                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FEATURES

 The sequence data in this record represents an 'enhanced' version of a phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associative, a phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -- Summary Statistics

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap-derived quality score. Sequencing vector: plasmid; n/a; 100% of reads
Sequencing vector: plasmid; n/a; 100% of reads
Assembly program: Phrzap; version 0.990319
Consensus quality: 178450 bases at least Q40
Consensus quality: 179436 bases at least Q30
Consensus quality: 179435 bases at least Q20
Insert size: 169000; agarose-fp
Insert size: 179622; sum-of-contigs
Quality coverage: 12.21x in Q20 bases; sum-of-contigs \* by the finished sequence as soon as it is available and
the accession number will be preserved.

1 27615: contig of 27615 bp in length
27716 63581: contig of 3886 bp in length
63582 63681: gap of unknown length
63582 79016: contig of 13886 bp in length
79017 79116: gap of unknown length
79017 91018: contig of 1392 bp in length
91019 94188: gap of unknown length
91019 94188: gap of unknown length
91019 94389: contig of 1302 bp in length
91019 94389: gap of unknown length Sison, C., Stantripop, S., Thomas, J.W., Thomas, P.J., Tsipour Vogt, J.L., Wetherby, K.D., Wiggins, L., Young, A. and Green, E NISC Comparative Sequencing Initiative consists of 7 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced Direct Submission Submitted (05-JUN-2003) NIH Intramural Sequencing Center, Grovemont Circle, Gaithersburg, MD 20877, USA On Jun 5, 2003 this sequence version replaced gi:25447561. Submitted (30-OCT-2002) NIH Intramural Sequencing Center, Grovemont Circle, Gaithersburg, MD 20877, USA 3 (bases 1 to 130254) Center: NIH Intramural Sequencing Center Web site: http://www.nisc.nih.gov Center code: NISC Green, E.D. TITLE JOURNAL REFERENCE AUTHORS JOURNAL COMMENT

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least BX average in confirmation by PCR testing. In addition, the sequence assemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990119
Consensus quality: 128674 bases at least Q20
Consensus quality: 128674 bases at least Q20
Insert size: 150000; agarose-fp
Quality coverage: 10.78x in Q20 bases; sum-of-contiguation.

NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces

\* is believed to be correct as given, however the sizes of the gaps between them are based on estimates that has provided by the submittor.

\* This sequence will be replaced.

\* This sequence will be preserved.

\* the accession number will be preserved.

The sequence in this assembly is a combination of BAC basec and whole genome shotgun sequencing reads assembled using and whole genome shotgun sequencing reads assembled using and therp://www.hgsc.bom.tmc.edu/projects/rat/). Each contig assembly (a 'contig-scaffold'). Within each contig di individual sequence contigs are ordered and oriented, and individual sequence contigs are ordered and oriented, and systed gaps filled with Ns to the estimated size. The sec may extend beyond the ends of the clone and there may be se Submitted (25-APR-2002) Human Genome Sequencing Center, Der of Molecular and Human Genetics, Baylor College of Medicine Baylor Plaza, Houston, TX 77030, USA (bases 1 to 16516) (Bat Genome Sequencing Consortium. contigs within a contig-scaffold that consist entirely of v genome shotgun sequence reads. Both end sequences and whole shotgun sequence only contigs will be indicated in the feat table. (bases 1 to 165316) Direct Submission Unpublished Worley, K.C.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: Estimated insert size may differ from sequence ler (see http://www.hgsc.bcm.tmc.edu/docs/Genbank draft_de NOTE: This is a "working draft' sequence. It currently consists of 7 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Baylor Plaza, Houston, TX 77030, USA
On May 10, 2003 this ascembly is a combination of BAC bases
The sequence in this ascembly is a combination of BAC bases
and whole genome shotgun sequencing reads assembled using,
(http://www.hgsc.bom.tmc.edu/projects/rat/). Each contig
in the feature table below represents a scaffold in the At
assembly (a 'contig-scaffold') Within each contig-scaffol-
individual sequence contigs are ordered and oriented, and
by sized gaps filled with Ns to the estimated size. The se-
may extend beyond the ends of the clone and there may be s-
contigs within a contig-scaffold that consist entirely of
genome shotgun sequence reads. Both end sequences and whol-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (06-NOV-2001) Human Genome Sequencing Center, Del of Molecular and Human Genetics, Baylor College of Medicin Baylor Plaza, Houston, TX 77030, USA (DABESE 1 to 223877)

* NOTE: Estimated insert size may differ from sequence le (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_d * NOTE: This is a 'working draft' sequence. It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that ha provided by the submittor.

* This sequence will be replaced * by the finished sequence as soon as it is available and * the accession number will be preserved.

On May 10, 2003 this sequence version replaced gi:25188701 The sequence in this assembly is a combination of BAC base and whole genome shorgun sequencing reads assembled using (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig (in the feature table below represents a scaffold in the Aliassembly (a 'contigs ecaffold'). Within each contig contig are ordered and coriented, and by sized gaps filled with Ns to the setimated size. The Sympy extend beyond the ends of the clone and there may be contigs within a contig-scaffold that consist entirely of genome shotgun sequence reads. Both end sequences and who shotgun sequence eadds. Both end sequences and who shotgun sequence cadds. Both end sequences and who shotgun sequence eadds. Both end sequences and who shotgun sequence cadds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Part Genome Sequencing Consortium.

Specifically, the indicat corder and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least RX average
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submission

Gaps between the contigs represented as runs of N. The order of the pieces believed to be correct as given, however the sizes the gaps between them are based on estimates that have sided by the submittor.

data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319

Consensus quality: 144765 bases at least Q30

Consensus quality: 146165 bases at least Q20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     consists of 11 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that hav
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Quality coverage: 8.83x in Q20 bases; agarose-fp Quality coverage: 9.03x in Q20 bases; sum-of-contigs

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicat order and orientation of each sequence contigh has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associate with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequencing vector: plasmid; n/a; 100% of reads
Sequencing vector: plasmid; n/a; 100% of reads

It currently consists of 12 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that hav provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note="assembly_fragment"

                                                                                                                                                                                                                       puence data in this record represents an 'enhanced' nof a Phase 2 submission. Specifically, the indicated and orientation of each sequence contigh has been ished using one or more of the following: read-pair com individual subclones, overlaps with neighboring alignment with available reference sequence (e.g., and/or confirmation by PCR testing. In addition, quence assembly is based on at least 8X average je in Q20 bases and has been reviewed to rule out misassemblies, the low-quality ends of sequence have been trimmed away, and each base is associated Phrap-derived quality score.

It currently ists of 12 contigs. Gaps between the contigs represented as runs of N. The order of the pieces likeved to be correct as given, however the sizes he gaps between them are based on estimates that have ided by the submittor.

Sequence will be replaced a cession number will be preserved.

On Nov 13, 2002 this sequence version replaced gi:23267374
The sequence in this assembly is a combination of BAC base and whole genome shotgun sequencing reads assembled using (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig (assembly (a contig-scaffold in the At assembly (a contig-scaffold). Within each contig-scaffol individual sequence contigs are ordered and oriented, and by sized gaps filled with Ns to the estimated size. The stands watchard beyond the ends of the clone and there may be contigs within a contig-scaffold that consist entirely of genome shotgun sequence reads. Both end sequences and who.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NOTE: Estimated insert size may differ from sequence legent by the sequence legent this is a "working draft' sequence. It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

New microarray, comprising a matrix of cDNA probe from a set of p immobilized to a solid surface in predetermined order, useful in prognosis of patients with clear cell renal carcinoma.

Claim 35; SEQ ID NO 223; 179pp; English.

The present invention relates to a microarray comprising a matrix least one cDNA probe from a set of probes immobilised to a solid in a predetermined order, where a row of pixels corresponds to re of one distinct probe from the set. The probes are complementary nucleic acid sequences that are expressed differentially in aggree compared to non-aggressive types of clear cell renal carcinoma (campared to probe under high stringency conditions microarray is useful for the prognosis of patients with CC-RCC, w

Screening for anti-neoplastic agent involves exposing cells to a agent to be tested for anti-neoplastic activity, and determining in expression of a gene of a signature gene set.

Claim 1; SEQ ID NO 1027; 44pp; English

The present invention describes a method (M1) for screening for neoplastic agent. The method involves exposing cells to a chemic to be tested for anti-neoplastic activity, determining a change expression of at least one gene (I) of a signature gene set, whe comprises a sequence (S) selected from 8447 sequences (given in . to ABL70110), or is at least 95% identical to (S), where a change expression is indicative of anti-neoplastic activity. (I) has cyactivity and can be used in gene therapy. MI can be used for scranti-neoplastic agent, and can be used for producing a product with data collected with respect to the anti-neoplastic agent as of MI, and the data is sufficient to convey the chemical structup properties of the agent. MI can be used in the treatment of cancerparts. scolon, breast, stomach, lung, thyroid, oesophageal, ovarian, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cancer, infiltrating ductal cancer, infiltrating lobular cancer, cell carcinoma, neuroendocrine carcinoma, papillary carcinoma an

end that is a 5' expressed sequence tag (5' EST) for as and genomic DNAs that correspond to 5'ESTs and for

diagnostic, forensic, gene therapy and chromosome mapping procedu Claim 1; SEQ ID NO 10997; 71pp + Sequence Listing; English. The present sequence is one of a large number of 5' ESTS derived mRNAs encoding secreted proteins. No ORF has yet been conclusivel identified within the present sequence. The 5' ESTS were prepared total human RNAs or polyA+ RNAs derived from 30 different tissues sequences usually correspond mainly to the 3' untranslated region of the mRNA because they are often obtained from oligo-dT primed libraries. Such ESTS are not well suited for isolating cDNA sequences have been obtained, the full 5' UTR is rarely incl C BSTs are derived from mRNAs with intext 5' ends and can therefore to obtain full length cDNAs and genomic DNAs. 5' ESTs are also us diagnostic, forensic, gene therapy and chromosome mapping procedu They are used to obtain upstream regulatory sequences and to desi expression and secretion vectors

New isolated tumor colon polynucleotide and polypeptide, useful diagnosis, prevention and/or treatment of cancer, in particular

Claim 1; SEQ ID NO 31; 266pp + Sequence Listing; English.

The invention relates to a human colon tumour expressed polynucle (I) encoding a polypeptide (II, ABP67991-ABP67996) comprising: (1 2600 fully) defined nucleotide sequences (ABV8669-ABV892899); (ii) complements of (i); (ii) asst 20 contiguous residues of (i); sequences that hybridize to (i), under moderately stringent condi

ariants of (i). The compositions and methods of the present e useful for the diagnosis, prevention and/or treatment of icularly colon cancer. (I) can be used in gene therapy and are useful in pharmaceutical compositions such as vaccines. quence data for this patent did not form part of the printed n, but was obtained in electronic format directly from WIPO s having at least 75% or 90% identity to (i); or (vi) int/pub/published\_pct\_sequences

leotide encoding colon tumor polypeptides, useful as treating colon cancers.

e 309; 425pp; English

a relates to isolated polynucleotides (I) encoding colon spitdes (II) (I) is useful for stimulating an immune a patient and treating colon cancer in a patient and treating colon cancer in a patient. a patient. (I) and (II) are useful in pharmaceutical e.g. vaccines, and other compositions for the diagnosis and colon cancer. A composition comprising a first component m physiologically acceptable carriers and immunostimulanes, en.presenting cell expressing (II) is useful for inhibiting of cancer in a patient. (I) is useful in the design and of ribozyme molecules for inhibiting expression of tumour and (I). ABK54531-ABK55464 represent human colon cancer cDNA the invention

```
The present sequence is the human hypoxia response regulating ge tralated CDMA clone 3D. The gene 7744 has similarity to steroid r transcriptional co-activator, SRA function and can serve as a co in some transcriptional complexes. It has vasotropic, cardiant, ophthalmological, cytostatic and cerebroprotective activity. Ant of the encoded protein, functions as a regulator of apoptosis or angiogenesis. The protein encoded by this polynucleotide, the biologically active product from enzymatic activity of the protein inhibitor of the enzymatic activity is useful for regulating hyp and treatment of tumour growth and ischaemia, e.g., retinopathy, myocardial infarction and stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polynucleotides capable of regulating angiogenesis or apopuseful for diagnosis and treatment of hypoxia, ischemia and tumo

i detecting the progression of liver cancer, hepatocellular metastatic liver tumor in a patient, involves detecting the ission of two or more genes in a liver tissue sample.

NO 729; 298pp; English.

relates to a novel method for diagnosing and detecting the liver cancer, hepatocellular carcinoma or metastatic liver itient, and differentiating metastatic liver cancer from carcinoma in a patient, involving detecting the level of two or more genes represented in ABN93503-ABN97455 in a The method of the invention has hepatocropic, and invity. The method is useful for diagnosing and detecting n of liver cancer, hepatocellular carcinoma and metastatic a in a patient. The method is useful for identifying files which serve as useful diagnostic markers as well as an be used to monitor disease states, disease progression, drug efficacy and drug metabolism. Note: The sequence data it did not form part of the printed specification, but was ectionic format directly from WIPO at ub/published\_pct\_sequences

New polynucleotide sequences obtained from various cDNA libraries as hybridization probes, as oligomers for PCR, for chromosome and mapping, in the recombinant production of protein, or in generatiantsense DNA or RNA.

WPI; 2003-615964/58.

Claim 1; SEQ ID NO 23899; 44pp; English.

The invention relates to an isolated polynuclectide comprising an 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose seque determined by the technique of SBH (sequencing by hybridisation). Included is a purified polypeptide comprising a sequence correspons reading frame of the novel polynuclectide. The nucleic acid sequence tust useful in diagnostics as expressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human in forensics, in assessing biodiversities, or in identifying muta responsible for genetic disorders and other traits. The nuclectid sequences are also useful as hybridisation probes, as oligomers for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or NNA. The purified poly is useful for generating antibodies specific for it. The present is one of the 38043 isolated cDNA.FST sequences. Note: The sequence for this patent did not form part of the printed specification, by obtained in electronic format directly from USPTO at segdata.uspto.gov/seguence.html?DocID=20030073623

Novel polynucleotide encoding colon tumor polypeptides, useful as vaccines for treating colon cancers. Claim 1; Page 403; 425pp; English. 03-JUL-2001; 2001US-0302702P. (CORI-) CORIXA CORP. WPI; 2002-257462/30. Pyle RA, Matches RESULT 53 셤 Š equence is one of a large number of 5' ESTs derived from g secreted proteins. An ORF has been identified within the 5' ESTs were prepared from total human RNAs or polyAt RNAs 3' different tissues. EST sequences usually correspond 3' untranslated region (UTR) of the mRNA because they are d from oligo-dT primed cDNA libraries. Such ESTs are not or isolating cDNA sequences derived from the 5' ends of nin those cases where longer cDNA sequences have been full 5' UTR is rarely included. 5' ESTs are derived from tact 5' ends and can therefore be used to obtain full length . 0 omic DNAS. 5' ESTS are also used in diagnostic, forensic, and chromosome mapping procedures. They are used to obtain latory sequences and to design expression and secretion cid that is a 5' expressed sequence tag (5' EST) for the and genomic DNAs that correspond to 5'ESTs and for orensic, gene therapy and chromosome mapping procedures. ```
The invention relates to isolated polynucleotides (I) encoding oc tumour polypeptides (II). (I) is useful for stimulating an immune response in a patient, and treating colon cancer in a patient.

Oligonucleotides derived from (I) are useful for determining the of cancer in a patient. (I) and (II) are useful in pharmaceutical compositions, e.g. vaccines, and other compositions for the diagratement of colon cancer. A composition comprising a first composition cancer in a patient. (I) is useful for inhical and antigen-presenting cell expressing (II) is useful for inhical and the conformation of cancer in a patient. (I) is useful in the design of preparation of ribozyme molecules for inhibiting expression of tupolypeptides and (I). ABK5531-ABK55464 represent human colon cares sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                        ·

Sequence is the human hypoxia response regulating gene, 77H4, clone 18E. The gene 77H4 has similarity to steroid receptor hal co-activator. SRA function and can serve as a coactivator scriptional complexes. It has vasorropic, cardiant, cloal, cytostatic and cerebroprotective activity. Antagonist of protein, functions as a regulator of apoptosis or The protein encoded by this polynucleotide, the active product from enzymatic activity of the protein or the enzymatic activity is useful for regulating hypoxia athologies (HAP). It is useful for gene therapy, diagnosis of tumour growth and ischaemia, e.g., retinopathy, farction and stroke

ed polypeptides and genes associated with hypoxia-regulated for treating stroke, hypoxia and ischemia. : 61; 72pp; English. nvention relates to a new polypeptide associated with ated activity. The invention is useful in diagnostic assays. Its further useful as a diagnostic tool which can be used to ix presence in a cell. The invention is also useful for sodies that could be used in diagnostic assays for the the protein and for determining if any given cell had been

subjected to neurotoxic stress. The invention can be used to proneural cells from, and ameliorate the effects of, hypoxia and is and thus in the treatment of stroke, hypoxia and ischaemia. The is also useful to prevent apoptosis and promote angiogenesis. The invention can be used in diagnostic assays for cells that have b subjected to hypoxia or ischaemia, and in screening assays to id agents capable of enhancing gene expression. The present nucleic sequence represents the human gene 7744 gene of the invention. N specification states that this sequence encodes the human gene 7 protein (ABG71808) but this does not appear to be the case 8888888888888

New Tumor Necrosis Factor family receptor polypeptides and ligand useful for diagnosis and treatment of prostate cancer and develop gestational abnormalities. 

Example VII; Page 121; 156pp; English.

This invention describes isolated Tumor Necrosis Factor (TNF) fam receptor polypeptides: APO4, APO6, APO8 and APO9 or their active fragments, and isolated TNF related ligands I and 3 (TNRL1 and TN their active fragments. APO4 is useful for diagnosing prostate ca determining levels of APO4 is useful for diagnosing prostate cancer can created using APO4 selective binding agents linked to a therapeut moiety. APO4 polypeptides are also useful for identifying selectivity agents, useful in diagnosis/treatment of disease by binding agents to the polypeptide/active fragment which is extracellular. Expressed on the cell surface. The binding are preferably performently on the cell surface. The binding are also useful for scripty expressed on the cell surface. The binding and observing the changer for agonists and antagonists by binding and observing the changer cartivity. Effective pharmacological agents useful in diagnosis or treatment of disease are also identified using APO4 polypeptides/ifragments and APO4 signal transducer molecules that specifically with a cytoplasmic domain of APO4 and detecting a change in level are all useful as immunogens for preparing antibodies. APO8 was transfected to human breast carcinoma cell and indicational MCF-7, and induced apoptosis

crosis Factor family receptor polypeptides and ligands - aganosis and treatment of prostate cancer and developmental al abnormalities.

Page 121; 156pp; English.

on describes isolated Tumor Necrosis Factor (TNF) family peptides: APO4, APO6, aPO8 and APO9 or their active of isolated TNF related ligands 1 and 3 (TNRL1 and TNRL3) or fragments. APO4 is useful for diagnosing prostate cancer by levels of APO4 in an individual. Prostate cancer can also be 3 APO4 selective binding agents linked to a therapeutic polypeptides are also useful for identifying selective is, useful in diagnosis/treatment of disease by binding of polypeptide/active fragment which is extracellular, or the call surface. The binding is preferably performed in olypeptides/ active fragments are also useful for screening and antagonists by binding and observing the changer in APO4 effective pharmacological agents useful in diagnosis or disease are also iseful in diagnosis or disease are also useful in diagnosis or disease are also useful in diagnosis or disease are also iseful in diagnosis or disease are also useful in diagnosis or disease are also disease lasmic domain of APO4 and detecting a change in level of APO4 method is performed in vivo or in vitro. APO polypeptides als as immunogens for preparing antibodies. APO4 is also agnosis/treatment of developmental or gestational and APO8 was transfected to human breast carcinoma cell line fective pharmacological agents useful in diagnosis or disease are also identified using APO4 polypeptides/active APO4 signal transducer molecules that specifically interact

Human; tumour necrosis factor; Apo-3 ligand; lymphotoxin; apopto NF-kappaB-dependent transcription; JNK/SAPK-dependent response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lymphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has cytostatic activity. Apo-3 ligand can be used to induce apoptosi mammalian cancer cells, to induce NF-kappaB-dependent transcript to induce JNK/SAFK-dependent responses in mammalian cells. The p sequence represents an Apo-3 ligand PCR primer, which is used in example from the present invention
                                                                                                                                                                                                                          Human tumour necrosis factor Apo-3 ligand PCR primer SEQ ID NO:5

Wention relates to the isolation of novel human PRO (AAU86128-AAU86162) and the polynucleotide sequences. The PRO POLYpeptides, agonists, antagonists or anti-PRO bladder, breast, etc), leukaemias and lymphoid other disorders such as neuronal, glial, astrocytal, glandular, macrophagal, stromal and blastocoelic disorders, immune and angiogenic disorders. The polynucleotide also useful in gene therapy. The present sequence brobe used in the methods of the present invention

The present invention describes a human tumour necrosis factor (T lymphotoxin homologue designated Apo-3 ligand. Apo-3 ligand has eytostatic activity. Apo-3 ligand can be used to induce apoptosis mammalian cancer cells, to induce NF-kappaB-dependent transcripti to induce JNK/SAFK-dependent responses in mammalian cells. The pr sequence represents an Apo-3 ligand PCR primer, which is used in example from the present invention
                                                                Human; tumour necrosis factor; Apo-3 ligand; lymphotoxin; apoptos NF-kappaB-dependent transcription; JNK/SAPK-dependent response; c

The invention relates to recombinant carcinoma associated (CA) n acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. invention also encompasses expression vectors and host cells com CA nucleic acid, a polypeptide (sepecially an antibody) that specialise to the protein, and a biochip comprising CA nucleic acid of fragments thereof. The sequences of the invention were identified oncogenic retrovituses, which insert into the genome of the host at random. Many of these do not carry transduced host oncogenes can parting viral genes, meaning that cancer inciden direct consequence of the effects of proviral integration into he protonocogenes. The CA nucleic acid sequences can be used to dia carcinoma despecially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the cof a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also usefi
                       The invention relates to human breast cancer expressed polynucle (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation betwee expression of certain markers and the cancerous state of breast. The polynucleotides and encoded polypeptides are potential mark detecting, diagnosing, monitoring, characterising treating and polypeptides are also useful for isolating compounds with cytost activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse; murine; carcinoma associated; oncogene; carcinoma; cancer prostate; lymphoma; leukaemia; cytostatic; gene therapy; drug sc

nucleic acid, useful for treating carcinomas, lymphomas, Lasm, adenocarcinoma, or sarcomas. Ħ,

(D NO 561; 2304pp; English.

relates to a novel recombinant nucleic acid comprising a quence selected from any of the 660 sequences fully defined location. A polymucleotide of the invention has cytostatic may have a use in gene therapy, or in a vaccine. The scheic acids and polypeptides are useful for treating 9. lymphomas, cancers, neoplasm, adenocarcinoma, and present sequence represents a mouse cDNA of the invention.

```
New recombinant nucleic acid comprising a nucleotide sequence of the carcinoma-associated (CA) genes, useful for screening for dru candidates for diagnosing or treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleotide sequence selected from any of the fully defined carcing associated (CA) genes from the 50 tables given in the specification of proteins are secreted, transmembrane or intracellular proteins recombinant nucleic acids are useful for screening for drug candifor diagnosing or treating carcinomas. Sequences given in ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention relates to a recombinant nucleic acid comprising a
                                                                                                                                Cytostatic; gene therapy; vaccine; cancer; carcinoma-associated secreted; transmembrane; intracellular; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1005 BP; 285 A; 268 C; 273 G; 179 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID NO 261; 983pp; English.
